

December 7 – December 11, 2020 Stand 16H72

The collective resources of **Rockford Manufacturing Group (RMG)**, **Fastener Engineers** and **Lewis Machine** represent leading innovation. We were the first company to develop the commercialized use of capstan, in-line wire drawers in 1962.

Our integrated in-line wire processing solutions are an excellent example of Lean Manufacturing. Customers quickly realize better quality, reduced inventory, improved productivity, greater flexibility and most importantly, reduced total cost.

In-line wire drawing provides numerous benefits for fastener and wire products industries. The equipment is used for many manufacturing processes that include fastener production, nail making, wire bending, concrete products, welded wire products and wire straighten and cutting.

Supporting the technology is service and support from RMG, which is the OEM for Fastener Engineers, Lewis Machine and G.C. Patterson equipment, and your best source for all your tooling and spare parts.

Attendees are welcome to visit our booth and see our patented Model 500 SPACESAVER In-Line Wire Drawer on display. This innovative solution has helped many of our customers better utilize their valuable production floor space. By incorporating the use of Spacesaver Wire Drawers, customers have been able to generate enough additional room to expand their manufacturing capacity within the same building.
